

The measurement of the BPL signals and interference issues brought forth in 04-37 should be put to an independant lab to set the standards and resolve these issues.

There is too much risk to liscensed services that maybe called upon at anytime and place to provide HF communications. Resolving interference issues in that kind of situation cannot be made fast enough or easy enough.

This is a grave decision before you and I really believe that the technology needs more time to address all the interference issues before going any farther forward. The goal should be no interference issues and if there are, we should stop 04-37 at that point.

Thank you for your consideration.
